Vexing VBA

Data Boot Camp

Lesson 2.2

Today, this is you.

Refresher

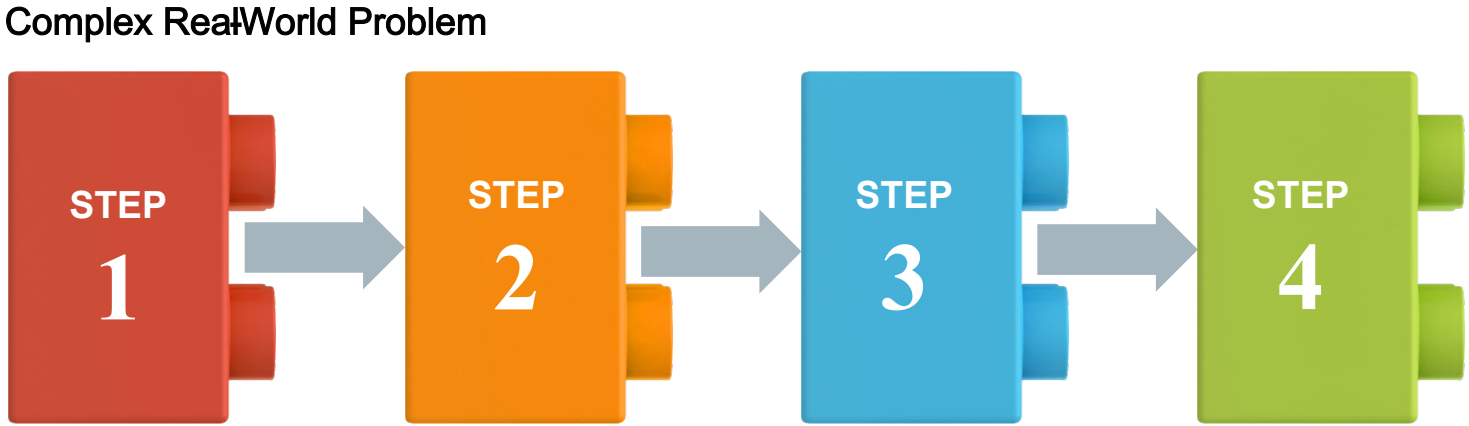
What does “coding requires thinking procedurally” mean?

How a Computer Thinks (Procedurally)

Every software development problem begins with a complex and abstract real-world need.

How a Computer Thinks (Procedurally)

In order for a computer to interpret things, a real-world problem must be broken down into a set of procedural steps.



How Code Is Written (Procedurally)

Code (JavaScript)

```
1  // STEP 1
2  //   ------------------------------
3  var thingamagig = 500;
4  var doodad = 200;
5
6  // STEP 2
7  //   ------------------------------
8  var combindedThing = thingamagig + doodad
9
10 // STEP 3
11 //   ------------------------------
12 runContraption (combindedThing);
13
14 // STEP 4
15 //   ------------------------------
16 resetContraption ();
```

What are the four fundamental tools of programming?

Fundamental Tools of Programming

These structures are found in nearly all programming languages:

Conditionals

Iterations

Functions

Variables / Arrays

Variables: The Nouns of Code

- **Variables** are effectively the items in a procedure.
- They can be **physical things** (like an ingredient) or **abstractions** (like a counter).
- In VBA, items can be **declared** as variables by using dim followed by a type. Then they can be **assigned** a value.

Variable Declaration

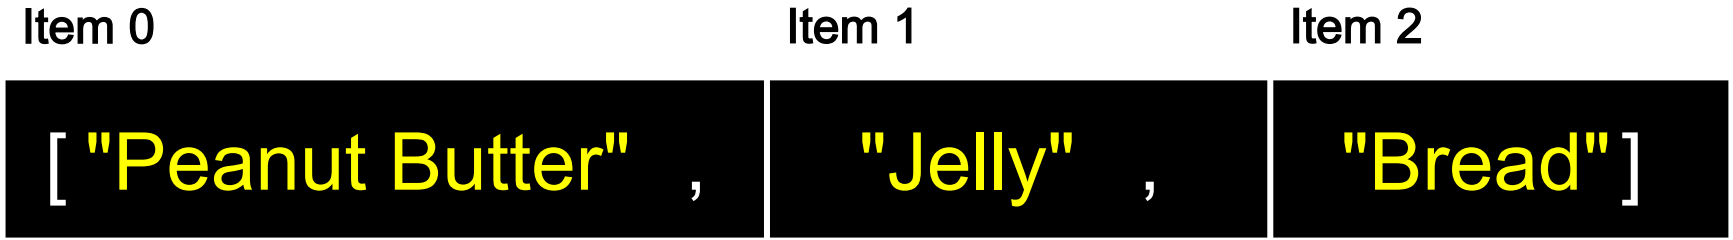
```
dim ing1  as String
dim ing2  as String
dim budget as Double
```

Variable Assignment

```
ing1  = "Peanut Butter"
ing1  = "Jelly"
budget = 5.00
```

Array: A Collection of Items

Arrays are effectively **groups** of related items. They are another way to store and reference similar pieces of information.



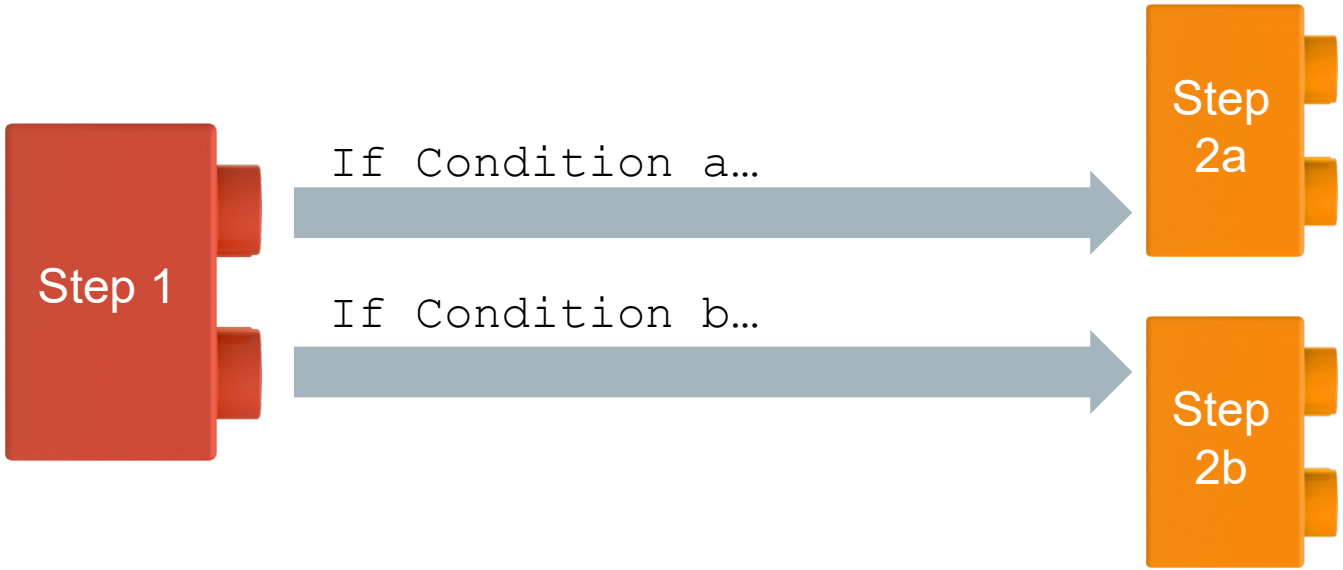
```
dim ingredients (0 to 2) as String

ingredients (0) = "Peanut Butter"
ingredients (1) = "Jelly"
ingredients (2) = "Bread"
```

Conditionals: If This, Then That

Conditionals can control the flow of logic based on certain conditions being met.

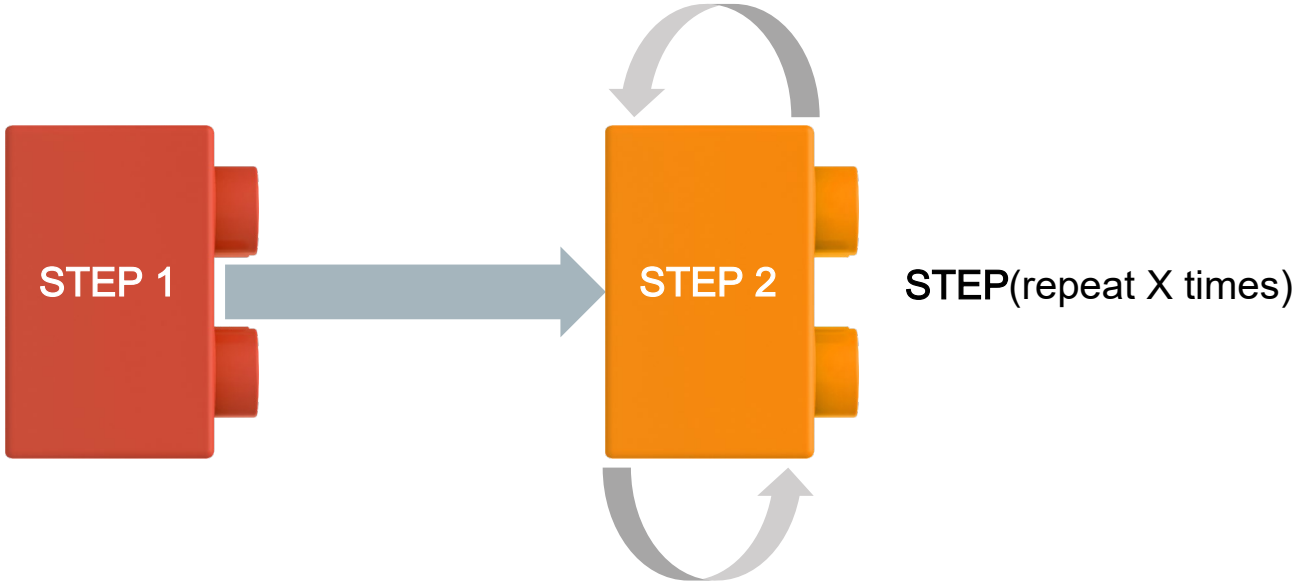
Most programming languages use **if/else** code for this purpose.



Iteration: Round and Round We Go!

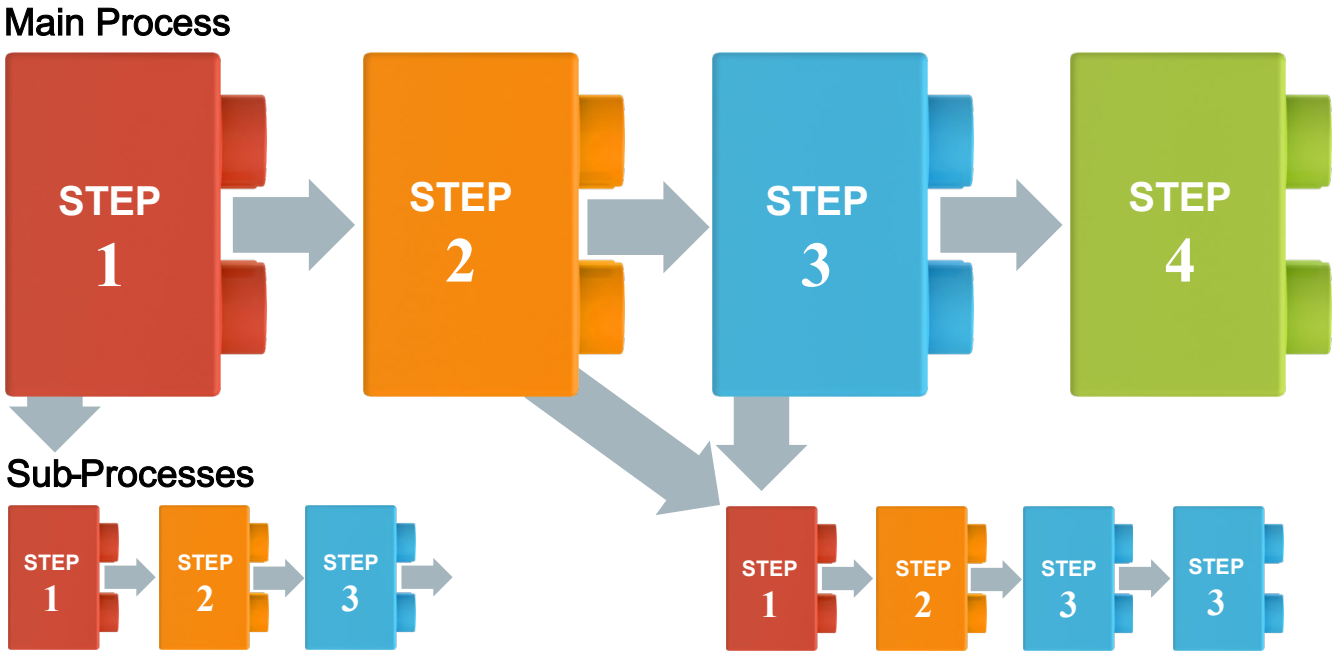
Iteration is the concept of using loops to perform a group of tasks repeatedly a number of times.

Almost all programming languages use **for loops** and **while loops** for iteration.



Functions: When One Block Can't Do It All!

Functions are, in essence, a sort of sub-process. They allow us to create premade, reusable blocks of code that can be called on demand.



Let’s Get Coding!
